A valid email address meets the following criteria:

- It's composed of a *username*, *domain* name, and *extension* assembled in this format:
`username@domain.extension`
- The *username* starts with an *English alphabetical character*, and any subsequent characters consist of one or more of the following: [alphanumeric characters](#), `-`, `.`, and `_`.
- The *domain* and *extension* contain only [English alphabetical characters](#).
- The *extension* is **1**, **2**, or **3** characters in length.

Given n pairs of names and email addresses as input, print each name and email address pair having a *valid* email address on a new line.

Hint: Try using [Email.utils\(\)](#) to complete this challenge. For example, this code:

```
import email.utils
print email.utils.parseaddr('DOSHI <DOSHI@hackerrank.com>')
print email.utils.formataddr(('DOSHI', 'DOSHI@hackerrank.com'))
```

produces this output:

```
('DOSHI', 'DOSHI@hackerrank.com')
DOSHI <DOSHI@hackerrank.com>
```

Input Format

The first line contains a single integer, n , denoting the number of email address.

Each line i of the n subsequent lines contains a *name* and an *email address* as two space-separated values following this format:

```
name <user@email.com>
```

Constraints

- $0 < n < 100$

Output Format

Author

DOSHI

Difficulty

Easy

Print the space-separated name and email address pairs containing *valid* email addresses only. Each pair must be printed on a new line in the following format:

```
name <user@email.com>
```

You must print each valid email address in the same order as it was received as input.

Sample Input

```
2
DEXTER <dexter@hotmail.com>
VIRUS <virus!@variable.:p>
```

Sample Output

```
DEXTER <dexter@hotmail.com>
```

Explanation

dexter@hotmail.com is a valid email address, so we print the name and email address pair received as input on a new line.

virus!@variable.:p is not a valid email address because the username contains an exclamation point (!) and the extension contains a colon (:). As this email is not valid, we print nothing.

Current Buffer (saved locally, editable)

Python 3

```
1 import re
2 n = int(input())
3 for _ in range(n):
4     x, y = input().split(' ')
5     m = re.match(r'<[A-Za-z](\w|-|\.|_)+@[A-Za-z]+\.[A-Za-z]{1,3}>', y)
6     if m:
7         print(x,y)
```
